INTRODUCTION

North Vietnamese weather stations are similar in appearance and function. They are normally surrounded by a small fence and contain 2 masts, each connected by wire to an instrument shelter. The shelters are small structures with louvered sides which house thermal and barometric instruments. Other equipment usually observed at these sites includes rain gauges and evaporation pans.

At the present time, weather stations in North Vietnam are used exclusively for the collection and transmission of weather data. However, a communications capability exists at each site and could be used to transmit information other than weather data.
